intro

- continue to consider our application's users
- primary challenge involves consideration of product development relative to both beginner and advanced users
- how to make usable and productive app for all concerned
- comprehensible and learnable for beginners
- do not hinder expert users from optimal productivity
- carefully consider user skill levels
- be aware of changes to skill levels over time
- aware of practical ways to help our users attain and improve skill levels
- understanding user's skill levels helps application of interaction concepts and principles

user categorisation - part 1

- we can often categorise users by application skill levels and aptitude
- evaluation user
- *testing and evaluating an app and not yet committed to its usage*
- trying to determine its suitability for their requirements
- no pressing tasks or action at hand

beginner user

- trying to accomplish some tasks with the application
- *little or no prior experience with the app's usage*
- general feelings of uncertainty and learning by trial and error, general experimentation
- some, but not all, will use the available tutorials, help documentation etc

Touch screens at Lincoln Park Zoo

Apes and Touch Screens at Lincoln Park Zoo Source: YouTube - Chicago Tribune

user categorisation - part 2

intermediate user

- more confident and experienced user, able to complete most of their required tasks
- unlikely they will have explored all of the app's features and options
- user comfort and fluency will not have been achieved for the application
- perpetual intermediates
- Cooper et al. 2007.

expert user

- greater application confidence and certainty
- awareness of product's domain and advanced options
- able to complete tasks with ease, solving problems as they arise...

power user

- considered an extension of an *expert* user with a fascination of the application
- normally enjoys customising the application and testing its limits

Users and skills

Your First Script - Apps Script Tutorials Source: YouTube

development of skills

- user classification is inherently a simplistic interpretation of skills acquisition and development
- many disparate factors influence development of skills. For example,
- domain knowledge
- assumption of underlying, pre-existing knowledge for a given application's scope
- general computing skills and knowledge
- many applications assume general computing skills and knowledge
- $\circ~$ eg: simple ability to use similar applications
- $\circ~$ ability to use their chosen mode and tools of interaction
- general intelligence and reasoning abilities
- an assumption of general reasoning and extrapolation skills
- ability to read and understand help documentation...
- persistence, motivation, and dedication
- $\circ\;$ some users will, of course, give up when faced with problems and challenges
- $\circ\;$ others are more persistent and will try to solve a problem or issue
- gamification and rewards may help this issue...

assumptions - part 1

- consider basic assumptions about users' minimum required skills and knowledge
- often dependent upon goals and functionality of the product, application...
- some inherent assumption of skills for your application
- eg: user will be able to use a keyboard, mouse, touchscreen...
- basic level of verbal, reasoning, and mathematical knowledge
- valid user testing important relative to such assumptions
- testing helps define and highlight unrealistic design choices and assumptions
- modify assumptions and design in response to testing feedback
- re-consideration and re-design may be necessary

assumptions - part 2

- assumption of Domain knowledge Documenta Latina
- gaming and applications
- eg: Royal Game of Ur

skill levels and design - part 1

evaluators

- *design needs to present good first impression, be pleasing overall, and inviting*
- should not give the impression of being overly complex
- *introductory material, such as demo video or guided tour with step-by-step instructions*
- *sample files, demo material allows users to test functionality and see what is possible*

beginners

- functionally easy for our users to learn and discover an application
- eg: offer wizard style guidance to create an initial project, document
- easy undo/redo errors and mistakes hopefully promotes experimentation in the app
- in-depth tutorials and intro guides, such as manuals, help videos, online help

Fun exercise - part 1

Consider a mobile or web based application to help users search for properties, e.g. house, apartment, to buy or rent

Then, outline the following

- initial UI concepts designed to engage and attract an evaluator user
- key features and functionality to allow a beginner user to quickly understand and use the application
- e.g. how to promote core functionality?
- how to encourage initial usage without a steep learning curve?
- ...

skill levels and design - part 2

intermediate

- *in addition to the above considerations*
- fully indexed and searchable help resources
- allow users to quickly find exactly what they need
- $\circ~$ online forums and social options and interaction promote sense of community

expert

- quick completion of tasks with maximum efficiency
- provide shortcut options, keys, and greater customisation options
- bypass and limit beginner tools, wizards, menus etc...

power

- allow greater freedom for users and interaction
- user developed scripts, plugins, add-ons
- developer tools, APIs, discussion forums, manuals...
- carefully consider security implications

Fun exercise - part 2

Continue the design of a mobile or web based application to help users search for properties...

Then, outline the following

- consider further features and functionality for intermediate and expert users
- how may we balance these new features with the previous requirements &c. for a beginner user?

skills change over time

- familiarity, experience, and comfort with an application often increase a user's skills
- skills tend to improve as follows
- *improved awareness of the application's options, tools, and capacity*
- *improved and increased awareness of how to perform tasks, handle special cases successfully*
- a much lower rate of errors, issues, and mistakes
- *increased rate of productivity and completion, speed, efficiency, and so on...*
- a general increase in confidence and greater ease at achieving a sense of flow with the application...
- might also expect general improvement in quality of work
- *quality often hard to define, measure, and assess*
- easier for procedural tasks and jobs than conceptual

practice makes perfect

- improve skills through regular practice
- for our applications and products
- ensure users practice and repeatedly perform given tasks
- some application scenarios naturally make it easier for users to practice
- simple act of repetition of regular tasks often mimics regular practice
- practice due to necessity
- "people generally become skilled in whatever becomes routine for them."
- Card et al. P.188. 1983.
- deliberate practice is the act of intentionally practicing with focused attention
- specific goal of improving skill levels, working and training at increasing levels of difficulty
- often requires careful monitoring and evaluation of work and results
- motivation and self-improvement important

Fun exercise - part 3

Continue the design of a mobile or web based application to help users search for properties...

Then, outline the following

- consider training and practice options for beginner and intermediate users
- how may we introduce both *implicit* and *explicit* options?

How to practice effectively...

'How to practice effectively...' Source: TED-Ed - YouTube

monitoring practice and skills

- Power Law of Practice Card et al. 1983
- applies to most mechanical and cognitive skills, not always relative to knowledge acquisition
- as users gain in experience relative to increased practice
- related application performance tends to increase rapidly, then slow to a steady rate
- steady peak normally reflects attained peak performance for the practiced skill
- lack of practice naturally leads to loss of performance and skill
- drop in frequency and intensity of practice
- motor skills do not normally atrophy as quickly as knowledge based skills
- simple to refresh these skills with a period of further training and practice
- designers need to be aware of this potential for skills atrophy * complex, detailed applications may consider detailed help systems, options * allow a user to quickly refresh knowledge using practice exercises, tests, incentives...

power law of practice

'How to read music' Source: TED-Ed - YouTube

gaining competence

- practice allows us to determine improvement relative to a given activity
- four stages of competence model suggested by Robinson in 1974
- this model suggests the following stages a user may follow to mastering a skill
 - unconscious incompetence
 - user is unaware of how bad he or she may be relative to a particular skill
 - may even by unaware that the skill exists
- conscious incompetence
- as user attempts a given skill, they become increasingly aware of a deficiency of skills
- realise need to improve that skill through further training, learning, practice...
- may be a daunting and overwhelming realisation for many users

• conscious competence

- practice allows a user to engage in training sessions, exercises...
- effectiveness of such training can vary greatly
- often dependent upon task itself, suitability of chosen practice and training

• unconscious competence

- complete a task without really thinking
- act of working, completing an exercise has become natural to the user
- do not really need to think about the given act...

games are a good example of hands-on training and practice
